The Norwegian Solution
The Greenest Data Center in Europe
ENERGY CRISIS IN THE DATA CENTER

Worldwide, data centers use about 400 terawatt-hours of electricity each year. That's a little more electricity than all of the United Kingdom uses.

BUILD OUT - PHASES

Level 1 – Power/Network infrastructure
Level 2 – Data center – Phase 3
Level 3 – Data center – Phase 1 – 40 MW – Tier III / 80 MW non-redundant
Level 4 – Data center – Phase 2
Level 5 – Future development
200 MW
Microsoft is committed to becoming carbon negative by 2030. This involves reducing carbon emissions and removing carbon from the atmosphere. The company is also aiming to remove its historical carbon emissions by 2050. A $1 billion climate innovation fund is being invested to support these goals.

Microsoft's pathway to carbon negative by 2030 involves reducing net carbon emissions, which includes Microsoft and its supply chain carbon emissions, Microsoft operational carbon emissions, avoided emissions offsets, and carbon removal. The graph shows the progression towards carbon neutrality over time, with the goal of becoming carbon negative by 2030.
WHY NORWAY

In a world of rapidly increasing carbon emissions from the ICT industry, Norway offers a sustainable solution. Norway has a 98.5% share of renewables in its power production. One foresees a significant surplus in the production and extremely competitive price forecasts for the years to come. Long term power prices in Norway are expected to be the lowest in the Nordics.

- Ranked 2nd worldwide in the Cushman & Wakefield 2016 Data Center Risk Index
- Abundant renewable power, strong grid and world leading long term power prices
- Competitive tax regime, strong economy, competent workforce
- Stable political situation, EU-compatible framework
